February 18, 2015

Mr. Mike Cherry, P.E. City Engineer/D.P.W. 200 First Street NE P.O. Box 616 Waverly, IA 50677

Re: 2015 Bridge Inspections

Dear Mr. Cherry:

We have completed the inspection of the roadway and rail-trail bridges for the City of Waverly.

Enclosed you will find the following information:

- 1. An inspection report, with recommendations, for the roadway and rail-trail bridges.
- 2. Photographs of the roadway and rail-trail bridges.
- 3. Copies of the Structural Inventory and Appraisal (S.I. & A) forms for the roadway bridges.
- 4. A copy of our Operating Rating Report for the roadway bridges.

With the exception of the 3<sup>rd</sup> Street SE bridge, the bridges were found to be in satisfactory condition with none in need of immediate repairs. Where necessary, we have listed recommendations for repairs in the summary for each bridge in the report.

As you are aware, we did recommend closure of the 3<sup>rd</sup> Street SE bridge to vehicular and pedestrian traffic last Friday, February 13th. As mentioned in previous inspection reports, this bridge has several significant problems in the superstructure, piers and abutments. During this inspection, we also noticed the occurrence of a crack in the web of one stringer and the initiation of a crack in another stringer, as well as indications of out-of-plane bending in the truss due to differential settlement of the deteriorated truss bearings. These, as well as many of the other issues mentioned in this report, are serious issues. Based on our engineering judgment, the deterioration of this bridge has advanced to the point where closure of this structure is necessary.

Various repairs have been completed on this bridge over the years to deal with localized problems which have extended the lifespan of the structure to this point. Although, due to the extent of deterioration, we do not believe future repairs are a feasible option for this structure. Performing long-term repairs on a structure of this type is very rare, due to the difficulty/costs associated with this type of work. Since this structure has so many significant issues, any short-term repairs would also involve a considerable amount of work. And, it is likely that future problems would arise in other members that were not repaired, due to similarities in structural details across the entire bridge. For instance, even if the two stringers mentioned were

Mike Cherry February 18, 2015 Page 2 of 2

repaired/replaced, there are well over 100 other similar stringers on the bridge that could start showing cracks at any time.

Please let us know if you have any questions regarding this report.

Sincerely,

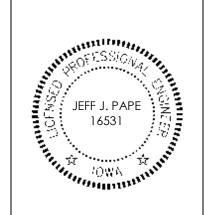

WHKS & co.

Jeff J. Pape Jeff J. Pape, P.E. jpape@whks.com

# **NBI Bridge Report**

# CITY OF WAVERLY 2013 ROADWAY BRIDGE INSPECTION

# 1<sup>st</sup> Street NW (Adams Pkwy) - FHWA No. 12240

# **Condition:**

Deck and Joints: There are some areas in the top of deck with small spalls and transverse cracks. The spalling is more pronounced adjacent to the joints at each abutment. Approximately 2% of the top of deck was delaminated; however the rate of increase is minimal, when compared to previous inspections. Most of the delamination occurs adjacent to the abutment expansion joints and above the piers where there is high negative flexure. We consider the deck to be in fair condition with some minor cracking and spalling.

The utility on the north side has the exterior casing slightly crushed. The gas main on the East side appears to be stressed tight against the cavity going through the abutment, at the NE corner.

**Curb and Sidewalk:** The curb along the full length of the bridge has some spalling and deterioration, however is guite minor.

**Abutments and Berms:** The bearings at each abutment are rusty. The base plates under the bearings at the south abutment have some pack rust with minor section loss (See Figure 2 in Appendix A). The base plates and bearings at the north abutment are also rusty but not as bad as the south abutment. There are a few hairline vertical cracks in abutments.

**Piers:** All piers have minor vertical cracks, particularly at the top and center of each pier, with up to 1/16" separation at the top, narrowing to just hairline at the waterline. Form tie holes in the piers either were not filled in or the grout has fallen out.

**Superstructure:** Due to the development of previous fatigue cracks, dual sets of holes have been drilled in the top of the girder webs near the transverse stiffeners directly over the piers and at each inflection point. The original fatigue cracks are still apparent between the dual holes, but no further cracking is apparent. The exterior side of the east girder has some surface rust spots in spans 1 and 2, possibly caused by rocks thrown at the bridge. Two top bolts in 2<sup>nd</sup> floor beam north of pier 3 at the inside of the West girder are missing, but likely not placed at construction.

# **Recommendation:**

We anticipate the need for a concrete overlay and new deck expansion joints within the next 5 to 10 years.

# 2<sup>nd</sup> Ave. NW - FHWA No. 502260

# **Condition:**

The top of deck is pitted with minor cracking. There are hairline cracks in the walls with some leaching. On the north end, there are cracks and some minor spalling where the wings meet the barrel of the culvert. The sidewalk slab bridge has a transverse crack near the center support and additional cracks at the east support under the rail posts. There is visible deflection of the sidewalk slab due to concrete creep. All barrels have minor silt in them.

# 2<sup>nd</sup> Street SW - FHWA No. 502300

# **Condition:**

There are hairline cracks in walls. The SE headwall has cracks with leaching and spalling on the roadway face that extend all the way through the headwall. The asphalt roadway near the NW headwall is broken up and has some depressions. There is a 3/8" wide crack at the south end of the NW headwall. There are cracks with leaching at the construction joints. There is minor settlement of the approaches adjacent to the culvert. Both barrels have minor silt in them.

# 3<sup>rd</sup> Street SE - FHWA No. 12250

# **Condition:**

**Posting:** The bridge is posted 5 tons, One Lane Bridge, and Low Clearance 8'-0 at both ends. Bridge was closed with signs and barricades at both ends following the inspection.

**Deck:** The deck is in satisfactory condition with some areas showing minor deterioration. The south pier joint cover plate on the top of the deck is loose and is vibrating the deck when traffic crosses.

**Superstructure:** There is significant pack rust typical at many connections. Pack rust is causing distortion of plates built up near bearings and

bulging of pins. There is also significant section loss (including through holes) of plates adjacent to the pins, and the connection has failed at the southeast and northwest bearings of the south truss resulting in some settlement of the truss, the southwest bearing is near failure. Two additional plates were welded to the gusset plates directly above the bearing pin, at the east side of the south abutment, during the 2006 repair in order to temporarily alleviate the potential for failure. Member U1-L2 on the east side of the south truss has slight sweep (out of plane bending) that is likely due to differential settlement of the truss at the failed bearings. There is section loss on some anchor bolts and nuts are not tight at several locations. The bearings are also tipped outward which is the opposite direction based on the current temperature.

At the bottom of the diagonals, pack rust is causing distortion of up to approx. 3/8" of the connection angles and up to approx. 1/8" section loss. Pack rust is causing up to approx. 1/4" distortion of the tie plates on the diagonal members. The repair performed at several verticals along the west side is deteriorating. There is pack rust between the original and repair materials indicating failure of the welds. There is pack rust between the angles in the west bottom chord between panel points two and five causing distortion and section loss. The overhead bracing members have minor pack rust as well. There is a loose bolt at the bottom chord connection to vertical six in the center truss, west side. Several other bottom chord connections have heavy pitting including on the fasteners. There is impact damage to diagonal L4-U5 on the west side of the center truss, diagonal L3-U4 on the east side of the center truss, and minor impact damage to tie plates at other locations. There are several discrete locations of leaf rust and other deformation to tie plates.

There is heavy pitting and significant section loss on floor beams and stringers. The flanges of the floor beams have the heaviest loss at the connections to the truss, but much of the section loss is not active and has been painted over. The webs have heavy pack rust and section loss at the connection angles to the stringers. The stringers have significant section loss in the flanges with some through holes. The webs have significant section loss especially at the connections to the floor beams. There are two stringers in the south truss that have serious section loss at the web connection to the floor beam, one that is cracked and the other with a crack initiating. Many of the locations that were repaired have pack rust between the original repair materials indicating failure of the webs and new section loss. There is significant deterioration of the stringer to floor beam connection angles, especially those with fasteners replaced by welds.

See Figures 1 to 18 in Appendix A for photos of superstructure deterioration.

**Sidewalk:** Pack rust has caused significant section loss in the bottom members of the sidewalk overhang bracket resulting in some through holes at the bottom of the web. The top plate of the

sidewalk overhang bracket is rusted through in some locations as well. The overhang bracket has significant section loss on the flanges with through holes in some areas. There is heavy leaf rust on the top flange of stringers under the sidewalk. There is heavy "white rust" on the bottom of the sidewalk pan. See Figures 14 to 16 in Appendix A for photos of sidewalk connection deterioration.

**Abutments:** Both abutments have vertical cracks with leaching. The north abutment has a large area that has been previously repaired, but is cracked and leaching again. There is significant delamination and spalling with some reinforcing exposed and corroded. The north backwall is cracked at the roadway adjacent to the bridge and appears to be crumbling. See Figures 19 and 20 in Appendix A for photos of abutment deterioration.

**Piers:** Areas of both piers near the waterline have large spalls, including a large spall in the north pier on the west end below the ice guard. The south pier has significant map cracking with leaching and the east end is spalling. The bridge seats are deteriorating especially on the south pier at the west bearing. See Figures 21 to 23 in Appendix A for photos of pier deterioration.

## **Recommendation:**

This bridge should remain closed to vehicular and pedestrian traffic due to the advanced deterioration of multiple aspects of this structure.

# 4<sup>th</sup> Ave. SW & 3<sup>rd</sup> Street SW – FHWA # 502250

# Condition:

There are minor transverse cracks with leaching in top of barrel near middle of NE barrel. There are minor cracks in the wingwalls. There is minor silting in both barrels. There is minor settlement of the approaches adjacent to the structure.

# 5<sup>th</sup> Ave. NW - FHWA # 502270

# Condition:

There are spalls in the south end of the 3<sup>rd</sup> wall from the west with reinforcing steel exposed. There are vertical cracks in the south corners of the culvert with reinforcing steel exposed. The sidewalk slab bridge has a transverse crack near the center support. There is visible deflection of the sidewalk slab due to concrete creep.

# 12<sup>th</sup> Street SE - FHWA # 79040

from the east in the north pier.

## **Condition:**

The bridge is posted "Semi Traffic Prohibited" on the north end. There are seven inches of asphalt and gravel with a chip seal surface on the bridge. The ends of all caps are split and some of them have begun to rot. The east end of the north abutment pile has rotted extendina cap approximately 12"+/- deep. Piles in the south abutment are leaning in slightly. The 1<sup>st</sup> pile from the East leans approximately 6" in 6', but movement seems stable from past inspections. Many piles have minor vertical splits in them. There is minor section loss of some stringers but is minor There is minor section loss in the 3<sup>rd</sup> pile

# 12<sup>th</sup> Street NW – FHWA # 12220

# **Condition:**

There are minor cracks with leaching in the walls and the top of the barrels. There is minor silting in all barrels. There is minor cracking and pitting on top of deck. The east end of the third wall from the south is spalled with some reinforcing steel exposed and starting to rust. There is some minor spalling at the northwest corner. Both approaches have minor settlement.

# 35<sup>th</sup> St. NW (Over Abandoned RR) – FHWA # 15511

# **Condition:**

There are minor hairline cracks in the top of deck and two small areas with exposed reinforcing near the center of the deck. There are minor diagonal cracks with leaching in bottom of deck at all four corners. The north approach is beginning to deteriorate near the joint. There is minor spalling in the concrete at some of the pier diaphragms.

# Rail-Trail Bridge Report

# CITY OF WAVERLY / BREMER COUNTY 2015 RAIL-TRAIL BRIDGE INSPECTION

## **BRIDGE LOCATION**

## **COMMENTS AND RECOMMENDATIONS**

# **#1 (INTERURBAN)**

### **Condition:**

The approach asphalt has settled and has been patched on both sides. The asphalt on the bridge deck has some transverse cracks. Some piles are split, show deterioration and sound hollow.

Recommendation: None

# #2 (IVANHOE)

### **Condition:**

The approach asphalt has settled approximately 3 inches and has been patched adjacent to the bridge. The asphalt on the bridge deck has some transverse cracks. Two piles adjacent to the west side of the gravel road in Pier 3 were damaged by vehicular collision some time ago and repaired. The repair job on these piles has failed and the piles now carry no support (See Photo 1). Load rating calculations show that the pile cap is sufficient to carry the current loading on the bridge. However, if the bridge is subject to heavier loading in the future (potentially for trail reconstruction) then repair work will need to be done to this structure.

Recommendation: Consider repairing damaged piling in Pier 3.

Photo No. 1 - Ivanhoe Pier 3

## **#3 (BASKINS CREEK)**

## **Condition:**

The approach asphalt has been patched at both abutments. The west abutment backwall is undermined allowing some fill material to move under the abutment. Some of the piles at the east end of the structure have fire damage. The outside piles and the 2<sup>nd</sup> pile from the south in the east abutment are in poor condition. A few of the piles near the center spans of the bridge (piles running through the creek) have advanced deterioration. The pile deterioration does not affect the overall stability of the bridge for current loading at this time.

## Recommendation:

Repair undermining problem at the west abutment.

# #4 (PRAIRIE RUN)

### Condition:

The approach asphalt has settled. The asphalt on the bridge deck has some transverse cracks. The hole in the east approach asphalt has been patched; however, the broken backwall has not been repaired (See Photo 2). There is some asphalt under the bridge next to the west abutment, which flowed through the backwall during construction. A few piles (mainly located in the creek) have some deterioration and sound hollow.

### Recommendation:

Repair the backwall on the east abutment.

Photo No. 2 – Prairie Run East Abut (2011 Photo)

# #5 (SLEMMONS RUN)

### **Condition:**

The approach asphalt is slightly settled. There is minor undermining of the abutment backwall at the east abutment. The asphalt on the bridge deck has some transverse cracks. The piles at the west abutment are not completely under the cap. The  $2^{nd}$ ,  $4^{th}$ , and  $6^{th}$  piles from the south sound hollow. The  $4^{th}$  pile has only about 25% of the pile under the cap. The east abutment piles are also not completely under the cap. Piles in the piers show varying levels of deterioration. The bracing between the piers is in very poor condition and in some cases has completely failed.

## Recommendation:

Repair undermining problem at the east abutment.

Note: For the current loading the loss of the bracing between the piers does not affect the structural capacity of the bridge.

# #6 (CEMETERY RUN)

## **Condition:**

There is some undermining of the west abutment. The asphalt on the bridge deck has some transverse cracks. The exterior pile on the south end of the east abutment is less than 25% effective. The south end of the east abutment cap is hollow about 3 ft. into the cap. The exterior pile on the north end of the west abutment is 25% effective.

### Recommendation:

Repair undermining problem at the west abutment.

# #7 (BANTAM)

## Condition:

Some piles are split, show deterioration, and sound hollow. The 12x12's under the center span bearings have some rotting and hollow areas in some members.

**Recommendation: None** 

# #8 (CEDAR RIVER)

### **Condition:**

Snow was obstructing much of the view of the top of deck, but as stated in the previous report, the top of deck is in satisfactory condition with some boards showing signs of wear and a few nails protruding from the top of the deck. At each pier and both abutments the limestone blocks show signs of deterioration (See Photo 3 and Photo 4). Cracks have developed in the mortar joints at both the 1<sup>st</sup> and the 2<sup>nd</sup> piers from the west and it appears that some settlement has occurred at both of these locations. In general, the condition of the limestone blocks at the piers and abutments is fair to poor with some of the primary structural elements showing signs of section loss and deterioration.

### Recommendation:

Repair any protruding nails.

Note: In general, the condition of the limestone blocks at the piers and abutments has reduced their structural capacity; however, it is our opinion that they are still structural sufficient for the current loading. We do recommend that the piers be closely monitored for additional settlement especially following a significant flooding event.

Mr. Mike Cherry City Engineer City of Waverly 200 First Street NE Waverly, IA 50677

RE: City of Waverly 3rd Street SE Bridge

**Discussion of Bridge Closure** 

Dear Mr. Cherry:

As you requested, we are providing a more detailed discussion on the closure of the 3<sup>rd</sup> Street SE Bridge over the Cedar River. The bridge is composed of three 75 foot truss spans. The bridge was inspected by WHKS on February 13, 2015 and it was determined that the bridge should be closed to all traffic at that time because of three serious deficiencies:

- Cracks in the webs of two stringers
- Deteriorated bearings
- Advanced section loss of the sidewalk overhang bracket

The following describes the reasons these specific deficiencies warranted the closure of the bridge. In each case it is clear failure of an individual element can negatively impact other elements and should not be considered acceptable. Photos of these deficiencies are included in the Appendix.

### **Impacts of Stringer Failure**

Failure of one stringer would result in the metal decking spanning a space between the adjacent stringers twice as large as it was designed for. As a result the decking would likely sag, if it could sustain the load at all, which could cause a dangerous driving surface which could cause drivers to lose control and have an accident.

The adjacent stringers would also be subject to greater forces as a result of the failure of one stringer. The general condition of the bridge is poor, and the adjacent stringers may not be able to support the additional load in their deteriorated condition.

### **Consequences of Bearing Failure**

A truss is a fracture critical structure because it lacks redundancy, or the ability to redistribute loads to other members if one should fail. If a single bearing failed and the bridge dropped at one corner there would be significant impact to the entire truss. The entire truss would be subject to loads it was not designed for as the span warps in response to the relative

displacement at one corner. If a truss member failed because these additional forces were too large for to sustain, the entire truss system could fail.

If a bearing fails, the bridge would not be able to respond to changes in temperature as designed. Additional forces will be induced in members because thermal movement (expansion and contraction) is restricted. The thermal movement of the bridge is dependent on properly functioning bearings.

The most noticeable impact would be the bump between spans or the approach roadway and the bridge if the bridge to dropped. This bump could cause a motorist to lose control and have an accident. The bridge also supports a natural gas line that could be compromised if a bearing failed causing the bridge to drop.

## **Sidewalk Closure**

Many of the sidewalk overhang brackets have significant section loss and corrosion. The deterioration is worst at the bottom flange near the support. This location is of primary concern because it is where the force in the member is the greatest. At the worst location there are cracks in the welds of the angles that form the bottom flanges, the angles have severe section loss and several through holes, and the web is no longer connected to the bottom flange rendering the section ineffective.

These brackets are spaced at each floor beam location, or panel point, just over 17 feet between brackets. Like the truss as a whole, these brackets are considered fracture critical because of the spacing. This means that if one bracket fails the sidewalk is also likely to fail. The sidewalk would fail because the stringers (which rest on top of the brackets beneath the sidewalk) would be spanning over 34 feet, which is a condition beyond their design, and the adjacent support brackets would be subject to more load.

## **Bridge Inspection and Rating**

WHKS understands that the sidewalk has been reopened to pedestrian traffic. However, our analysis shows that the sidewalk overhang bracket does not have the capacity to support the full American Association of State Highway and Transportation Official (AASHTO) design pedestrian load. AASHTO is a federal design code that establishes criteria to ensure safety of the traveling pubic for new designs as well as load rating of existing structure.

Our rating analysis considers the condition of the worst bracket as described above. The worst case element must be analyzed when rating the bridge because it is the most likely to fail and have negative impacts on other elements.

Our initial inspection report documented in more detail the deterioration at several other areas of the bridge. There are several truss members bent out of plane. The floor beams, stringers, and truss connections have significant section loss and leaf rust in many areas. The concrete piers and abutments are also deteriorating.

As the inspector and bridge program manager public safety is our primary concern. We must consider the ability of the structure to continue to support loads over time before the next inspection. We take in to account the current condition and factor in the historical rate of

Recipient Name October 21, 2015 Page 3 of 6

deterioration to try to predict how much load the structure will continue to safely support over the next inspection cycle (barring unforeseen and unpredictable events). It is our opinion that the current condition of the structure combined with the deterioration that will continue over time presents too great a risk to the public to keep the bridge open.

Sincerely,

WHKS & co.

Casey V. Faber, P.E.

Bridge Inspection Program Manager
